The BGP, which RFC 1771 defines, allows you to create loop-free interdomain routing between autonomous systems (ASs). An AS is a set of routers under a single technical administration. Routers in an AS can use multiple Interior Gateway Protocols (IGPs) to exchange routing information inside the AS.

BGP Case Studies - Cisco

Attributes Overview Routes learned via Border Gateway Protocol (BGP) have properties that are associated with them that aid a router in determining the best route to a destination when multiple paths to that particular destination exist. These properties are referred to as BGP attributes.

BGP is a standardized exterior gateway protocol (EGP), as opposed to RIP, OSPF, and EIGRP which are interior gateway protocols (IGP's). BGP Version 4 (BGPv4) is the current standard deployment. BGP is considered a "Path Vector" routing protocol. BGP was not built to route within an Autonomous System (AS),

The current version of BGP is BGP version 4, based on RFC4271. BGP is the path-vector protocol that provides routing information for autonomous systems on the Internet via its AS-Path attribute. BGP is a Layer 4 protocol that sits on top of TCP. It is much simpler than OSPF, because it doesn't have to worry about the things TCP will handle.

- OSPF, IS-IS, BGP are needed in the network
- They provide reachability
- Label distribution protocols distribute labels for prefixes advertised by unicast routing protocols using Either a dedicated Label Distribution Protocol (LDP) Extending existing protocols like BGP to distribute Labels

Packet Tracer BGP Configuration Example. To understand BGP (Border Gateway Protocol) better, we will make a basic Packet Tracer BGP Configuration example. Because of the limited numbers of commands available on Packet Tracer, we will practice a very basic configuration for our BGP Config Example. Beside this, I will add some additional configuration steps that is needed for IBGP but we can not ...
